Y:\WP\Reports\Residential\215215 Eastmark Master Drainage Report Update (for DU 1-2-5W).docx

EXECUTIVE SUMMARY

This report supersedes the approved *Master Drainage Report for Eastmark*, dated December 9, 2019, and has been prepared to specifically address revisions to the land uses within Development Units 1 (DU 1), 2 (DU 2), 5 West (DU 5W), 3/4 (DU 3/4), 6 North (DU 6N), and 6 South (DU 6S), and other updates within several Development Units. More detailed land use planning within DU 1-2-5W, DU 6N, and DU 6S has been provided to Wood, Patel & Associates, Inc. (WOODPATEL) by DMB Mesa Proving Grounds, LLC. Portions of DU 3/4 have already been constructed or are in the process of construction. The next phase of development within Eastmark is planned to include the Commercial Core located at the northeast corner of Ray Road and Ellsworth Road, DU 1, DU 2, DU 5W, and residential parcels in DU 6S.

Changes to the *Master Drainage Report Update for Eastmark* include:

- Development Unit 5 North (DU 5N) was separated into East and West portions to delineate planned development parcels.
- Revised boundary of DU 6N and DU 6S. DU 6N decreased to approximately 208 acres, while DU 6S increased to approximately 475 acres.
- Combined boundary of DU 1, DU 2, and DU 5W, which is now called DU 1-2-5W. This area is planned as a single property.
- Revised DU 1-2-5W, Development Unit 5 East (DU 5E), DU 6N, and DU 6S land uses, boundaries, and naming convention to reflect more detailed planning of parcel boundaries, based on potential end users.
- Revised land uses within DU 3/4 and DU 6S, to reflect more detailed planning.
- Revised offsite land uses and retention for Sub-basin 78C to reflect recent site grading and recorded final plats, specifically from the La Mira development.
- Revised Post-Developed Condition Hydrology including updates to reflect recently constructed and future planned retention.
- Adjusted Sub-basins 8 and 10 to reflect the as-built condition.

Refer to Exhibit 1 – *Vicinity Map*.

1.0 INTRODUCTION

1.1 General Background and Project Location

The proposed Eastmark development (formerly known as Mesa Proving Grounds) is an approximate 3,154-acre master planned community being developed in the City of Mesa (City). It is a Planned Community District (PCD) which is a mixed-use development that will include single-family residential, multi-family residential, urban mixed-use, commercial mixed-use, office, industrial, hotel, resort, various community uses, and open spaces. This *Master Drainage Report for Eastmark* utilizes planning and as-built plans provided by DMB Mesa Proving Grounds, LLC and the City of Mesa to model drainage throughout the Site.

This Master Drainage Report has been prepared in accordance with Wood, Patel & Associates, Inc.'s (WOODPATEL) understanding of the City and the Flood Control District of Maricopa County (FCDMC) drainage requirements.

The Site is located within Sections 14, 15, 22, 23, 26, and 27, Township 1 South, Range 7 East of the Gila and Salt River Meridian. The Site is bounded by Elliot Road to the north, Williams Field Road and Cadence (formerly Pacific Proving Grounds) on the south, Ellsworth Road to the west, and Signal Butte Road to the east (refer to Exhibit 1).

The pre-developed Site consisted of multiple automotive test tracks and undisturbed desert used by General Motors. Portions of the Site have been developed into industrial land uses, including the Apple industrial building at the southwest corner of Elliot Road and Signal Butte Road and the Edge Core data center located on the west side of Everton Terrace at the south end of DU 5E. Existing single-family residential, commercial, school, and community uses are also located within Development Units 3S, 3/4, 6S, 7, 8, and 9. Portions of the planned development units are constructed or under construction.

The majority of the Site is surrounded by undeveloped desert along the northern and western boundaries. Along the eastern boundary, the Site is bordered by two (2) existing residential developments, Nova Vista and Bella Via (formerly known as Mountain Horizons) and a future development along the southern edge called La Mira. Grading of La Mira has been completed, and residential units will be built in 2021. Along the western portion of the southern boundary, the initial phases of Cadence have been constructed. Along the eastern portion of the southern boundary, the proposed

development Destination of Gateway has been planned but not constructed, and additional undeveloped land remains.

In addition, the Powerline Floodway Channel bisects the Site along the Ray Road alignment. This is a major FCDMC facility that provides conveyance of discharge from the FCDMC Flood Retarding Structures, approximately three miles east of the Site, and drainage conveyance for storm water runoff for areas adjacent to the channel. Ultimately, the flow is conveyed to the East Maricopa Floodway (EMF) west of the Site.

1.2 Scope of Master Drainage Report

The Master Drainage Report was prepared to support the proposed development at Eastmark. The drainage analysis is consistent with procedures and standards of the City of Mesa and the Flood Control District of Maricopa County. The proposed drainage plan provides an outline for the required major drainage facilities for storage and conveyance of storm water runoff for the development of Eastmark.

The Site is planned as a PCD. In accordance with the PCD, the total square footage of non-residential, and total number of residential dwelling units developed within the Site, may be less than contemplated in this report. Also, the actual location of land uses may be different than contemplated in this report within the undeveloped areas of the Site. There are ten (10) development units that comprise the PCD that have been realigned to nine (9) units within this Master Plan update. Within each development unit are low-and high-density ranges for development. Regardless of the land use, the required retention volume will be predicated on the final land use consistent with the drainage design requirements for the City of Mesa, and meeting existing-condition peak flows and runoff volumes leaving the Site.

Due to the flexible nature of the Community Zoning, the land uses have varied significantly from initial planning to final plat, therefore regular Master Plan updates have been prepared to account for the most current construction and planning. Additionally, sizing of onsite drainage infrastructure such as channels and storm drain would vary greatly with different land uses and roadway layouts. Therefore, it is not feasible to accurately model storm drain, and consequently, is not included. The needed layout and sizing of such systems will be determined and designed by the Engineer preparing construction documents and Final Drainage Reports, and will follow routing contemplated within this report.

A more detailed analysis of the drainage system for each development unit was previously provided with each Development Unit Master Drainage Report. Each Development Unit Master Drainage Report addressed the interim condition, including developed, undeveloped, and current Development Unit planning that followed current proposed construction phasing within Eastmark. This report has been updated to include the revised land use planning for DU 1-2-5W, DU 5E, DU 6N, and DU 6S, with minor adjustments to land uses for the as-built remainder of the Site. Updates to the Master Drainage Report may be required if future significant changes are made to the land uses and assumptions utilized to prepare this report.

1.3 Development Unit Master Plan Approvals

As each development unit is planned, this *Master Drainage Report for Eastmark* shall be updated as a living document to reflect changes to the land use plan that would affect the full build-out drainage system. Each development unit shall be master planned, utilizing current approved criteria which accurately reflects drainage conditions on a master planned level for the entire community. The approvals of development unit drainage master plans and corresponding criteria are as follows:

- DU 7 – Approved report dated December 20, 2011 with 2009 City of Mesa drainage criteria.
- DU 8 and 9 – Approved report dated February 4, 2013 with 2009 City of Mesa drainage criteria.
- DU 3S – Approved report dated December 16, 2013 with 2009 City of Mesa drainage criteria.
- DU 5, DU 5N, and DU 6S – Approved report dated April 26, 2017 with 2012 City of Mesa drainage criteria.
- DU 3/4 – Approved report dated December 9, 2019 with 2019 City of Mesa drainage criteria. Since the construction of DU 1-2-5W completes the drainage infrastructure in the northwest site corner, there is no longer an interim condition for DU 2; therefore, an update to the DU 2 Master Plan in unnecessary.
- DU 2 – Approved report dated December 9, 2019 with 2019 City of Mesa drainage criteria. The construction of DU 1-2-5W completes the drainage infrastructure in the northwest site corner therefore DU 2 no longer has an interim drainage condition and revisions to the DU 2 Master Report are not necessary.

2.0 DESCRIPTION OF STUDY AREA

2.1 Existing Soil Conditions

According to the Natural Resources Conservation Service's Soil Survey, Eastmark is located within the Aguila-Carefree soil survey area. The majority of the surface soils onsite are classified as sandy loam, clay loam, or loam. Refer to Exhibit 2 – *Soils Map*, and Appendices A and B for information pertaining to existing soil conditions.

2.2 Rainfall Seasons

There are two distinct rainfall seasons associated with the desert southwest corresponding to the project area. The first season occurs during the winter months from November to March when the area is subjected to occasional storms from the Pacific Ocean. While classified as a rainfall season, there can be long periods with little or no precipitation. Generally storms occurring during the winter rainfall season are classified as being long duration, low intensity storms.

The second rainfall period occurs during the summer months of June through August, and is commonly referred to as Monsoon Season. During this season, Arizona is subjected to widespread thunderstorm activity whose moisture supply originates both in the Gulf of Mexico and along Mexico's west coast. These thunderstorms are typically classified as being short duration, high intensity storms with extreme variability per location.

2.3 FEMA Flood Insurance Rate Map (FIRM)

The Maricopa County, Arizona and Incorporated Areas Flood Insurance Rate Map (FIRM) Panel Number 04013C2760L, dated October 16, 2013, indicates that the western edge of the Site, approximately 800 acres, is within Zone "X" Shaded.

Zone "X" Shaded is defined by FEMA as follows:

> *"Areas of 0.2% annual chance flood: areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood."*

Panel Number 04013C2760L also indicates area beyond the eastern map boundary is within Zone "D". The FEMA website indicates this area is within the Maricopa County, Arizona and Incorporated Areas Flood Insurance Rate Map (FIRM) Panel Number 04013C2780L. The FEMA website shows the panel as not printed, and does not indicate a flood zone designation. Based on the Zone "D" markings on Panel Number 04013C2760L, and previously-mapped Panel Number 04013CIND0A, dated September 30, 2005, portions of Eastmark within Panel Number 04013C2780L, approximately 2,160 acres is believed to be within a FEMA Zone "D".

Zone "D" is defined by FEMA as follows:

"Areas in which flood hazards are undetermined."

The remaining southern-most portion of Eastmark, approximately 190 acres, is located within Panel Number 04013C2790L. The FEMA website shows the panel as not printed, and does not indicate a flood zone designation. The Maricopa County, Arizona and Incorporated Areas Flood Insurance Rate Map (FIRM) Panel Number 04013CIND0A dated September 30, 2005, references Panel Number 04013C2715F, which indicates that the southern-most portion of the Site is within "No special flood hazard areas". Panel Number 04013C2715F has a note that states "Panel Not Printed – No Special Flood Hazard Areas".

"No special flood hazard areas" is defined by FEMA as follows:

"All areas within 0.2% annual chance floodplain."

Refer to Exhibit 3 – *Flood Insurance Rate Map* for an illustration.

2.4 Section 404 Jurisdictional Areas

A Jurisdictional Delineation was completed by the U.S. Army Corps of Engineers (Corps) on the Site. The Powerline Floodway channel, a small wash, and a detention basin have been designated as Jurisdictional. The Powerline Floodway and wash are jurisdictional conveyance facilities, and the detention basin is considered a jurisdictional wetland. Refer to Exhibit 4 – *Section 404 Jurisdictional Delineation Map* for location of Jurisdictional Areas.

It is WOODPATEL's understanding an individual permit was obtained for disturbance to the wash and basin, and the Powerline Floodway has remained undisturbed.

2.5 East Mesa Area Drainage Master Plan

The East Mesa Area Drainage Master Plan (ADMP), prepared in 1998 by Dibble & Associates, Inc. and Hoskin Ryan Consultants, Inc., is a regional drainage study prepared for the FCDMC. Eastmark is located in the eastern portion of the study, which is bound by the FRS in Pinal County to the east and the EMF to the west. In general, the area drains northeast to southwest and outlets into the EMF. The ADMP sets the regional drainage constraints for facilities within the study area of Eastmark.

HEC-1 hydrologic models for the East Mesa ADMP were provided by FCDMC. The MIDCURE.DAT model, which supersedes previous HEC-1 models, was updated and utilized as the existing condition model for the *Master Drainage Report for Eastmark*. In addition, the WS4-SEM.DAT model provided by the FCDMC was updated and utilized to analyze the full build-out condition. Refer to Exhibit 8 – *East Mesa Area Drainage Master Plan Map* for regional drainage facilities.

Anticipated future studies may be conducted under the auspices of FCDMC. Results of future studies may reflect a reduction of offsite peak flows impacting existing and future drainage infrastructure within Eastmark. Peak flow evaluation for design of future facilities should consider the most current published East Mesa ADMP. It is anticipated the City of Mesa will accept relevant changes and allow for future drainage infrastructure to utilize the most current peak flow information.

2.6 Upstream Development

The upstream watershed has been mostly developed between Signal Butte Road and Meridian Road, in Maricopa County. The watershed within Pinal County is undeveloped to the FRS.

The upstream residential developments' approved drainage reports are referenced in this Report. The storm water storage and conveyance facilities were incorporated into the hydrologic models of the *Master Drainage Report for Eastmark.*

3.0 PRE-DEVELOPED DRAINAGE CONDITION

3.1 Pre-Developed Drainage

The existing slope of the Site ranges from 0.5 percent to 1 percent. The Site slopes from northeast to southwest. However some historic drainage patterns have been altered to route offsite flows around the Site and onsite flows around existing automotive test tracks. In the pre-developed condition the Site was covered with typical Sonoran Desert vegetation including mesquite trees, saguaro cactus, creosote, etc.

Berms surrounding the Site, north of the Powerline Floodway, were estimated to retain 75 percent of the storm water runoff produced onsite by the Flood Control District of Maricopa County, and have been modeled accordingly within the current 100-year, 24-hour FCDMC model. The remaining onsite storm water, approximately 261 cfs, discharged in a location near the GM buildings and into the Powerline Floodway. Onsite storm water runoff from the portion of the Site south of the Powerline Floodway discharged downstream to the undeveloped Cadence community (formerly known as Pacific Proving Grounds) through existing channels and natural washes (refer to Exhibit 5 – *Pre-Developed Condition HEC-1 Schematic*).

3.1.1 Northern Boundary

Offsite flows impacting the northern boundary are currently collected and conveyed within the Elliot detention basin and storm drain system. The majority of offsite flows are conveyed north of Elliot Road in natural washes. The washes discharge to the existing Elliot Road detention basins which discharge flows to the Elliot storm drain system. These flows are conveyed west to Ellsworth Road through a 78-inch to 114-inch diameter storm drain. Additional storm water runoff produced northeast of the Elliot Road and Ellsworth Road intersection is added to the storm drain system by a 90-inch diameter storm drain beneath Elliot Road. In the pre-developed condition, approximately 1,323 cubic feet per second (cfs) within the storm drain system is then conveyed south along Ellsworth Road through a double-barrel 102-inch diameter storm drain. Approximately 1,500 feet south of the intersection, the flow is directed southwest beneath Ellsworth Road and outfalls into a channel that crosses the Arizona State Land Department property and connects to the Loop 202 drainage channel. Ultimately, these flows discharge to the EMF.

3.1.2 Eastern Boundary

Offsite flows impacting the eastern boundary between Elliot Road and Ray Road are diverted south by existing channels, washes, and berms along the west side of Signal Butte Road. In the pre-developed condition, approximately 419 cfs impacts the Site near Warner Road from an existing double-barrel 10-foot by 3-foot box culvert from Bella Via (formerly known as Mountain Horizons). A channel along the west side of Signal Butte Road was constructed with DU 7 to convey the offsite flow south to the Powerline Floodway, south of Ray Road.

The primary function of the Powerline Floodway is to be the principal outlet for the FRS structures to the east, and secondly, to convey overland flow from the area west of the FRS to the EMF. At Signal Butte Road, the floodway is estimated to carry approximately 697 cfs during the 100-year, 24-hour storm event, based on the pre-developed condition model. These flows are conveyed within the Powerline Floodway, and combine with onsite flows from Eastmark at Ellsworth Road. The combined flow at Ray and Ellsworth Roads is estimated at approximately 661 cfs, based on the updated pre-developed condition model. At this point, runoff continues westerly, combines with the Ellsworth Road channel, and discharges to the EMF. Future analysis of the Powerline Floodway hydraulics and capacity shall include the base flow of 600 cfs in addition to the 100-year calculated peak flow at specific locations. The base flow is the outlet discharge anticipated from Powerline, Vineyard, and Rittenhouse flood retarding structures.

Offsite flows impacting the eastern boundary of Eastmark, from Ray Road to Williams Field Road, are diverted south by an existing channel along the west side of Signal Butte Road. There are two point impacts from the Bella Via development. One is approximately 1,000 feet south of the Powerline Floodway, where offsite flows are conveyed through an existing double-barrel 10-foot by 3-foot box culvert. The second point impact is at the Galveston Street alignment, where offsite flows are conveyed through an existing double-barrel 8-foot by 3-foot box culvert. These combined flows are estimated to be approximately 694 cfs.

Between the Galveston Street alignment and Williams Field Road, the upstream impact is from a combination of the recently-graded La Mira property, consisting of 105 acres, and additional low-density residential area further east within the Maricopa County jurisdiction, which has an approximate peak flow of 775 cfs. The flow is collected within the existing channel and combines with additional flow through an existing box culvert along the north side of Williams Field Road. The combined flow, of approximately 947 cfs is then conveyed west within the channel along the north side of Williams Field Road and discharges to an existing channel within the Cadence community. The Cadence channel routes the flow around the property, and discharges to the Ellsworth channel. In the post-developed condition, the onsite peak flow discharging to the channel is reduced due to onsite retention for the 100-year, 2-hour storm event.

3.1.3 Western Boundary

The western boundary is not impacted by offsite flows entering the Site. As mentioned in Section 3.1.1, the Elliot Road storm drain system continues south along Ellsworth Road. Approximately 1,500 feet south of Elliot Road, the storm drain discharges into a channel on the west side of Ellsworth Road. There are other existing storm drain systems along Ellsworth Road that were constructed by Maricopa County Department of Transportation (MCDOT). One system, north of Warner Road, connects to the Elliot Road storm drain system. The second system is south of the Elliot Outfall Channel and connects to the Powerline Floodway.

3.1.4 Southern Boundary

There are no offsite impacts crossing the southern boundary along Williams Field Road. There are several discharge points to Cadence along this common boundary. In the existing conditions, the 4 discharges are approximately 90 cfs, 225 cfs, 156 cfs, and 1,090 cfs from north to south, respectively.

3.2 Pre-Developed Condition Hydrology

Pre-developed condition hydrology has been modeled utilizing *DDMSW Version 3.3.2*, provided by the FCDMC, and the *United States Army Corps of Engineers HEC-1, Flood Hydrograph Package, Version 4.1*, (June 1998) to determine offsite and onsite peak flows prior to the development of the Site for the 100-year, 24-hour storm event. Refer to

Exhibit 5 – *Existing Condition HEC-1 Schematic*, and Appendix A for the HEC-1 output. The MIDCURE.DAT model provided by FCDMC was updated and utilized for previous approved *Eastmark Master Drainage Reports*. This Eastmark Master Drainage Report Update does not include any revisions to the pre-developed condition hydrology.

The precipitation depth of 3.60 inches in the model was not changed. Rainfall losses were calculated using the Green and Ampt method. Parameters were taken from soil data collected using the NRCS Web Soil Survey and existing land uses. In order to remain consistent with the current FCDMC MIDCURE.DAT, the Phoenix Valley S-Graph was used to develop runoff hydrographs. Runoff hydrographs were routed using the Normal Depth Storage Routing Method. See Appendix A for data and models used to develop the pre-developed condition hydrology.

4.0 PROPOSED DRAINAGE CONDITION

4.1 Proposed Drainage Plan

The overall drainage concept for Eastmark is to route offsite flow through and around the Site within channels and storm drain systems to discharge flows at their historical location and provide retention of onsite storm water in accordance with jurisdictional requirements. Refer to Exhibit 6 – *Post-Developed HEC-1 Schematic*, and Exhibit 7 – *Post-Developed Drainage Map* for watershed delineations and locations.

Offsite flows impacting the northern and eastern boundaries will be collected within existing channels and conveyed to historic outfalls, as described in Section 3.0 of this report.

Onsite flows will be conveyed through a hierarchy of roadways and storm drain systems to onsite retention basins for storage. Retention basins are designed to retain runoff generated by the 100-year, 2-hour storm event for the majority of the Site and 100-year, 24-hour storm event for the remaining site to reduce post-developed runoff volumes and peak flows to pre-development levels. Onsite runoff in excess of these storm events will be discharged within emergency outfall drainage corridors, roadways and/or storm drain systems as provided by the final design engineering of each site and development phase. In all locations, lowest floor elevations shall be set a minimum of one foot above the emergency overflow elevation or any 100-year water surface elevation adjacent to the Site, whichever is greater.

The Site has been divided into ten (10) development units and realigned to nine (9) units within this Master Plan Update. The individual development units are highlighted and labeled on Exhibit 6 and Exhibit 7. If the density varies at the development unit stage, the hydrology will be reanalyzed in the overall Master Plan revisions. Interim drainage conditions have been analyzed within individual Development Unit Master Drainage Reports. More detailed planning for DU 1-2-5W, DU 5E, DU 6N, and DU 6S, and minor land use updates throughout the development has been incorporated within this study. With the minimal remaining undeveloped property, Development Unit Master Plans and interim-condition modeling are no longer required.

Storm water retention for the 100-year, 2-hour event will be stored locally within each individual development parcel. The reduction of peak flow and runoff volume from Eastmark discharging to the Powerline Floodway requires a portion of the site to retain the 100-year, 24-hour storm event. Watersheds 7B, 7C, and 9 are constructed or currently under construction. A portion of these watersheds were modeled with 100-year, 24-hour storage, as previously only a portion of these watersheds were required to retain the 100-year, 24-hour volume. Future development within Watersheds 01, 02C, 03, and 7A will be required to retain the 100-year, 24-hour storm event.

The Great Park is planned as a multi-functional area including passive and active recreation and will provide 100-year, 24-hour storm water storage for the park. The Great Park Master Plan will include provisions for lake design, retention, landscaping, improvements, and other amenities.

Retention basin sizing is discussed further in Section 4.5, illustrated on Exhibit 7, and summarized in *Table 10 – Onsite Retention Volume Summary* in the appendices. In the event that the basin capacities are exceeded, excess flow will be conveyed by emergency outfall corridors along roadways and/or landscaped tracts as specified by the improvement plan design engineer. The corridors are based upon our understanding of final design and planning by others and are modeled along Mesquite Street Alignment, Everton Terrace, Warner Road North, Point Twenty-Two Boulevard, and Ray Road.

Retention basins shall be designed to drain retained runoff within 36 hours after a storm event. Land uses depicted in the hydrologic models are conceptual and subject to change based on the allowable criteria for the zoning. Each development unit will have a Master Drainage Report that will substantiate any changes from this *Master Drainage Report*.

4.2 Proposed Condition Hydrology

WOODPATEL coordinated with FCDMC between 2006 and 2009 to update the existing condition hydrology of the upstream watersheds and create a proposed full build out hydrologic model for the development of the first version of the Master Drainage Report for Eastmark. In addition, hydraulic analysis was performed on FCDMC facilities including the Powerline Floodway, East Maricopa Floodway, Rittenhouse, and Chandler Heights Detentions Basins, to verify these facilities were not adversely affected by the proposed development of the Site. The individual parcel retention concepts within this report are consistent with the previous Master Drainage Reports completed at Eastmark,

and demonstrate lower 100-year, 24-hour discharges and volumes, as compared to the FCDMC model.

FCDMC provided their full-buildout model, WS4-SEM.DAT, which was updated and utilized for this and superseded *Master Drainage Reports*. Refer to Exhibit 6 and Appendix B for the HEC-1 model and supporting documentation. A combination of constructed grading and a master grading plan, provided by DMB Mesa Proving Grounds, was utilized to delineate onsite sub-basins. The Rational Method was used to determine 100-year, 2-hour and 100-year, 24-hour required retention volumes, and the volumes were inserted into the model as diversions. Based on point precipitation frequency estimates from NOAA Atlas 14, the 100-year, 2-hour precipitation is 2.19 inches and the 100-year, 24-hour precipitation depth is 3.51 inches. Flows in excess of proposed basin capacities were routed downstream to historic outfall locations as identified in the existing condition HEC-1 model. Future development parcels will address onsite retention and interim condition discharges to the Powerline Floodway and downstream regional drainage facilities. The analysis shall be submitted to the City of Mesa for approval and concurrence and may be forwarded to FCDMC by the City for review at their discretion.

Offsite Sub-basins 77B, 77C, 78C, and 79A were updated to reflect current developments within the previous Eastmark masterplan update. Within the proposed-condition model EM125W.DAT, previous changes have been incorporated and additional offsite sub-basins have been modeled with unchanged parameters. Offsite retention volumes were calculated and modeled using approved drainage reports for the adjacent developments with 80 percent of the total required retention volume for each sub-basin being diverted within the HEC-1 models for retention. The remaining 20 percent of the required retention volume was considered not to be retained, consistent with FCDMC requirements to account for unknowns and neglect of maintenance.

Offsite routing parameters along Signal Butte Road and Williams Field Road reflect existing channels planned to convey offsite flows along the boundary. The following table provides a summary of 100-year, 24-hour discharges for the pre-developed and proposed conditions which indicates decreased peak discharges leaving the Site.

PRE-DEVELOPED CONDITION		PROPOSED CONDITION	
Location ID	**Discharge**	**Location ID**	**Discharge**
CP 75	661cfs	CP75	626 cfs
79A1	90 cfs	RET17	1 cfs
79A2	225 cfs	CP19A	57 cfs
79A3	156 cfs	RET19	134 cfs
C79B1	1,090 cfs	CP22B	944 cfs

4.3 Proposed Hydraulics

4.3.1 Street Hydraulics

Arterials and major collectors shall be designed to convey the peak flows generated by a 10-year peak storm within the roadway infrastructure with a spread limited to one traffic lane in each direction. All other public roadways shall be designed to convey the peak flows generated by a 10-year peak storm between the curbs. All roadways shall be designed to convey the 100-year storm within the right-of-way and adjacent parkway. Where the peak flows exceed the capacity of the public street to convey the peak flows, storm drains or other drainage facilities shall be installed and sized to carry the excess flows (i.e., when the 10-year peak exceeds the spread criteria or exceeds the curb capacity of the public street, or when the right-of-way cannot convey the 100-year peak). Storm drain and channel systems will convey storm water runoff to retention basins located throughout the Site.

4.3.2 Powerline Floodway Channel, Channel Corridors, and Storm Drain Systems

The Powerline Floodway channel and the existing drainage corridor along Signal Butte Road and Williams Field Road will be used to route offsite flows through and around the Site to their historical discharge locations. For design of these facilities, refer to the design reports completed by others.

The Powerline Floodway between Signal Butte Road and Ellsworth Road is planned to remain undisturbed. In the future, any modifications to the Powerline Floodway will require updated hydrology and hydraulic modeling with detailed construction documents for review and permitting by the FCDMC and the City of Mesa.

Existing storm drain systems within Ellsworth Road collect and convey storm water runoff produced within the roadway rights-of-way to drainage facilities downstream of Eastmark, per the previously approved Drainage Report *MCDOT Project No. 68927-2 Ellsworth Road – Phase 2 Ray Road to Portobello Avenue* by Stantec Consulting, Inc., dated December 2004, and the *Drainage Report for Point Twenty-Two Boulevard and S. Ellsworth Road Infrastructure at Eastmark*, by Wood, Patel & Associates, Inc., dated January 18, 2018. The north Ellsworth storm drain system collects runoff for the 10-year storm event from approximately one-half mile south of Elliot Road and connects to the Elliot storm drain system. Retention, as required for this east half-street of Ellsworth Road, will need to be provided.

The south Ellsworth storm drain system collects runoff from approximately one-half mile south of Elliot Road and discharges to the Powerline Floodway channel. Retention, as required for this east half-street of Ellsworth Road, shall be provided as necessary. A portion of Ellsworth Road runoff in the 100-year storm event may be discharged to the south Ellsworth storm drain. This will need to be evaluated and approved in detail when Ellsworth Road is widened to its ultimate cross-section.

Research of the Elliot Road storm drain system and approved drainage report *Elliot Road Detention Basins and Outfall Channel Phases I and II*, by WOODPATEL, dated May 2000, indicates that no site-specific hydraulic calculations were performed for the roadway storm drain stub-outs. Elliot Road was previously widened to full buildout. At this time, it is unknown which existing storm drain stub-outs were utilized from the as-built plans, dated December 2003. However, Elliot Road was included within the watershed, and the assumption was made the Elliot storm drain system was designed to accommodate the 100-year, 24-hour storm event for the rights-of-way.

The proposed channels adjacent to Signal Butte Road and Williams Field Road have been constructed. These channels convey storm water runoff produced within the roadway rights-of-way, combined with offsite flows east of the Site to drainage facilities downstream of Eastmark. The flow impacting the Site north of

Ray Road will be conveyed in a channel southerly along Signal Butte and combined with the Powerline Floodway, then conveyed through the Site and discharged at Ray and Ellsworth Roads, as it does in the historical condition. The flow impacting the Site south of Ray Road will be conveyed in a channel southerly along Signal Butte, then westerly along Williams Field Road, and discharged to the existing channel on Pacific Proving Grounds, as it does in the historical condition.

4.4 Erosion and Sedimentation Control

4.4.1 Erosion Control

The proposed development is planned to utilize engineered channels and storm drain systems to collect and convey offsite flows through and around the Site. Due to the relatively flat topography, improved channels will be designed for "sub-critical" flow. Proper channel protection shall be designed and specified within final drainage reports in conjunction with detailed improvement plans.

Onsite runoff shall be conveyed within a hierarchy of roadways, landscaped tracts, channels, and storm drain systems to retention basins. The onsite conveyance system will minimize erosion and sediment deposition. Best Management Practices shall be applied to control erosion and sedimentation during Site construction.

4.4.2 Sedimentation

Special consideration must be taken in regards to sedimentation. The Site lies within an area that has a history of sediment issues. The cohesionless soils, sparse vegetation, and high-intensity rainfall cause large amounts of sediment to move through washes and channels. There is continual, dynamic interaction between sediment particles and the transporting medium, water. Culverts and channels shall be designed with slope and velocity to carry sediment through the system and prevent large amounts of sediment deposition.

4.5 Retention

4.5.1 Retention Storage

In the pre-developed condition, the portion of the Site north of the Powerline Floodway was retained by a series of berms along Ellsworth, Elliot, and Signal Butte Roads. Due to this condition, the FCDMC required Eastmark to retain the majority of runoff from the 100-year, 24-hour storm event in the proposed condition. Twenty-five percent (25%) of the onsite flow, approximately 261 cfs, from this sub-basin is allowed to discharge into the Powerline Floodway. The modeling indicates storage for the 100-year, 2-hour storm event for the majority of the Site, with the remaining portion of the Site storing runoff from the 100-year, 24-hour storm will reduce peak flows and volumes discharging from the Site lower than the original East Mesa ADMP and subsequent FCDMC models. By providing onsite storage, FCDMC drainage structures downstream will not be negatively impacted due to the decreased peak flows and runoff volumes. The table below illustrates this along the Powerline Floodway:

Discharge Location	Updated FCDMC Full-Buildout Model	Eastmark Updated Full-Buildout Model
Powerline Channel at Ellsworth (75TPC)	672 cfs	626 cfs
	181 ac-ft	167 ac-ft

To further evaluate the impacts of the onsite retention, analysis of additional downstream FCDMC facilities was performed. This included review of pre-development and post-development flowrates and water surface elevations along the Powerline Floodway and EMF. Also, review of the impacts to the FCDMC Rittenhouse and Chandler Heights detention basins was performed to verify these facilities are not being negatively impacted. HEC-1 and HEC-RAS models, provided by FCDMC, were updated based on the post-developed condition of Eastmark. Since flows from DU 1, DU 2, and DU 5W are reduced, the table below illustrates the results of the previous analysis.

Basin	Location	Cross-Section	Original Design		Update Eastmark Model	
			Peak Flow (CFS)	Water Surface Elevation (FT)	Peak Flow (CFS)	Water Surface Elevation (FT)
Rittenhouse	EMF	17.082	5,897	1,322.01	5,474	1,321.18
Rittenhouse	EMF (Lateral Weir)	16.93	3,536	1,316.70	3,355	1,316.43
Rittenhouse	EMF	16	3,887	1,315.36	3,715	1,315.20
Chandler Heights	Queen Creek Wash	5535	5,536	1,308.60	5,535	1,308.60
Chandler Heights	Queen Creek Wash (Lateral Weir)	5377	2,312	1,308.47	2,309	1,308.47
Chandler Heights	Queen Creek Wash	1084.9	2,304	1,301.95	2,308	1,301.95
Chandler Heights	EMF	13.084	3,859	1,305.83	3,697	1,305.69
Chandler Heights	EMF (Lateral Weir)	11.987	3,806	1,301.75	3,686	1,301.68
Chandler Heights	EMF (Lateral Structure)	11.74	4,361	1,301.10	4,346	1,301.07
Chandler Heights	EMF	11.033	6,610	1,299.40	6,553	1,299.37

As shown by the results, FCDMC facilities are not negatively impacted by retention for the 100-year, 2-hour and 100-year, 24-hour storm events on Eastmark.

Provided retention for areas within Eastmark currently developed, under construction, and designed, and has been incorporated within the update of this Report. The required retention shown on Table 10 assumes typical runoff coefficients from the FCDMC design manuals. However, final design of the development units accounts for the actual runoff coefficients used by the design engineers, which varied slightly from the assumptions made by this overall Master Plan. Therefore, some development units actual required retention is less than the volume contemplated within this report. The required retention volumes for the areas north and south of the Powerline Floodway are 430.7 ac-ft and 76.7 ac-ft, respectively. The current retention provided based upon final drainage reports provided to WOODPATEL for the areas north and south of the Powerline Floodway are 215.8 ac-ft and 48.4 ac-ft, respectively and the modeled retention volumes are 426.0 ac-ft and 82.1 ac-ft, respectively. As shown on Table 10, if a sub-basin is fully constructed, the retention modeled in HEC-1 is the retention provided. If the sub-basin is not fully constructed, the volume modeled represents the retention required.

Refer to Table 10 within Appendix B, and Exhibit 7 at the end of the report, for a detailed summary of required retention volumes per applicable watershed. This is based on a 100-year, 2-hour precipitation depth of 2.19 inches and 100-year, 24-hour precipitation depth of 3.51 inches obtained from NOAA Atlas 14 Precipitation Frequency Data. Retention basins will be required to dissipate storm water within 36 hours.

4.5.2 Stormwater Quality

The required retention storage volume for the Site exceeds the first flush requirement of storing the first one-half inch of runoff. All runoff will have settlement time within retention basins prior to draining by percolation, drywells, release into natural watercourses, and/or release into existing storm drain systems.

4.6 Sustainability Techniques

Eastmark is anticipated to be developed as a sustainable community. Designs will incorporate simple techniques to manage storm water in a practical manner that will be considered environmentally responsible. In the future, new techniques and technologies will advance in sustainable storm water management that may be incorporated into the Site.

4.7 Maintenance

Ongoing maintenance of the designed or recommended drainage systems will be required to preserve the design integrity and purpose of the drainage system. Failure to provide maintenance can prevent the drainage system from performing to its intended design purpose, and can result in reduced performance. Maintenance is the responsibility of private developers and owners associations for facilities on private property within all easements and private streets, except for drainage structures within public rights-of-way accepted by the City of Mesa for maintenance. Ownership and maintenance responsibilities will be associated with developments discharging to retention facilities and will be managed by the owners associations established for the Site. A regular maintenance program is required to have drainage systems perform to the level of protection or service as presented in this report.

5.0 CONCLUSIONS

Based on the analysis of the *Master Drainage Report for Eastmark*, the following conclusions can be made:

1. This *Master Drainage Report for Eastmark* is prepared in accordance with Wood, Patel & Associates, Inc.'s understanding of the drainage parameters set by the Flood Control District of Maricopa County and the City of Mesa.

2. Offsite flows shall be conveyed through and around the Site adequately per jurisdictional requirements. Individual Development Unit Master Drainage Reports may also be submitted to FCDMC, by the City of Mesa, with the appropriate modeling for review and approval as the Site develops.

3. Peak flows and runoff volumes for the post-development 100-year, 24-hour storm shall not exceed existing conditions as calculated using HEC-1 computer modeling.

4. Onsite retention shall be provided to retain runoff generated by the 100-year, 2-hour storm event for the majority of the developed areas and 100-year 24-hour retention in key locations which will prevent post-developed discharges from exceeding historical existing condition discharges.

5. Analysis of downstream FCDMC structures including the Powerline Floodway, East Maricopa Floodway, Rittenhouse Detention Basin, and Chandler Heights Detention Basin show development as proposed within this report for Eastmark does not have negative impacts on these facilities.

6. Flow in excess of onsite storage capacity shall outfall in historic locations with existing condition characteristics without increasing historical flows.

7. Lowest floor elevations shall be set a minimum of one foot above the adjacent 100-year water surface elevation or emergency outfall water surface elevation, whichever is greater.

8. Drainage infrastructure will be designed in accordance with the appropriate criteria per the City of Mesa and/or Flood Control District of Maricopa County.

9. Ongoing maintenance is required for all drainage systems in order to assure design performance.

  45          ID    3) ADDITIONAL ID RECORDS PROVIDED BELOW TO FURTHER EXPLAIN THE MODELING
  46          ID       ASSUMPTIONS MADE FOR THE ELLIOT BASINS UNDER EXISTING LAND USE CONDITIONS
  47          ID    4) THE STUB DIVERSION AT THE INTERSECTION OF ELLIOT AND ELLSWORTH ROADS HAS
  48          ID       BEEN REVISED TO TAKE 180 CFS.
  49          ID
  50          ID   ADDITIONAL MODELING NOTES:
  51          ID    THE PEAK FLOW AT THE END OF CRISMON CHANNEL AFTER THE DIVERSION OF THE 404
  52          ID    FLOW IS 1443 CFS.  OF THIS 1443 CFS, 410 CFS IS DIVERTED INTO THE ELLIOT
  53          ID    DRAIN.  THE REMAINDER OF THE FLOW IS THEN DIVERTED INTO BASIN WA AND ROUTED
  54          ID    THROUGH THROUGH BASIN WB.
  55          ID

 127      ID                  East Maricopa Floodway Capacity Mitigation Study
 128      ID    PREPARED FOR:  Flood Control District of Maricopa County
 129      ID     PREPARED BY:  Huitt-Zollars, Inc
 130      ID        FILENAME:  X-SEMESA.DAT
 131      ID            DATE:  Dec 1999
 132      ID
 133      ID   This model is for the 100-year, 24 hr existing conditions event
 134      ID   for the watershed area tributary to the EMF approximately between
 135      ID   Queen Creek Rd./Rittenhouse Rd. and the Superstition Freeway.
 136      ID
 137      ID   This model was constructed from previous study models and updated
 138      ID   for new existing hydrologic conditions as part of the Queen Creek/
 139      ID   Sanokai Wash HMP & EMF Capacity Mitigation Study.  Previous
 140      ID   studies include the East Mesa ADMP and the Queen Creek ADMS.
 141      ID
 142      ID   This model is one of four supporting hydrologic models used to
 143      ID   evaluate flow in the East Maricopa Floodway (EMF).  Each model
 144      ID   evaluates the hydrology for a specific area that is ultimately
```

```
 145          ID    tributary to the EMF. The four supporting models are:
 146          ID
 147          ID       *  X-NWMESA.DAT - Existing conditions hydrology for NE Mesa
 148          ID                         (~east of the EMF to the CAP(at Hawes Rd.)
 149          ID                         & ~south of McKellips Rd. to US60)
 150          ID
 151          ID       *  X-NEMESA.DAT - Existing conditions hydrology for NW Mesa
 152          ID                         (~area northeast of Hawes Rd./US60)
 153          ID
 154          ID       *  X-SEMESA.DAT - Existing conditions hydrology for SE Mesa
 155          ID                         (~area east of the EMF from US60 south to
 156          ID                          Rittenhouse Rd. {excluding areas
 157          ID                          tributary to Queen Creek})
 158          ID                          X-SEMESA.DAT imports hydrographs from
 159          ID                          X-NEMESA.DAT via DSS files.  Therefore,
 160          ID                          X-NEMESA.DAT must be run first and then
 161          ID                          when running X-SEMESA.DAT, X-NEMESA.DSS
 162          ID                          must be specified as the DSS file
 163          ID                          (the default would be X-SEMESA.DSS)
 164          ID
 165          ID       *  X-QCSW.DAT   - Existing conditions hydrology for Queen
1                                          HEC-1 INPUT                                                PAGE  4

LINE          ID.......1.......2.......3.......4.......5.......6.......7.......8.......9......10

 166          ID                         Creek/Sanokai Wash area (all areas
 167          ID                         tributary to Queen Creek & Sanokai Wash
 168          ID                         and areas tributary to the EMF south of
 169          ID                         Rittenhouse Rd.)
 170          ID
 171          ID    IT IS IMPORTANT TO NOTE THAT THE SUPPORTING MODELS DO NOT
 172          ID    CORRECTLY ROUTE FLOWS ALONG THE EMF NOR DO THEY IMPORT ALL
 173          ID    THE NECESSARY FLOWS TO CORRECTLY EVALUATE FLOWS WITHIN THE
 174          ID    EMF.  TO EVALUATE FLOWS WITHIN THE EMF, ALL THE SUPPORTING
 175          ID    MODELS SHOULD BE RUN (TO DEVELOP THE TAPE21 FILE) AND THEN
 176          ID    THE EMF ROUTING MODEL (X-EMF-RT.DAT).  ONLY THE EMF ROUTING
 177          ID    MODEL SHOULD BE USED TO DETERMINE FLOWS WITHIN THE EMF.
 178          ID
 179          ID    The model X-EMF-RT.DAT is the "routing" model used to evaluate
 180          ID    flows in the EMF for the existing conditions.  The model imports
 181          ID    hydrographs via TAPE21 files from the supporting hydrologic
 182          ID    models and then routes them along the EMF from approximately
 183          ID    Brown Rd. and south to Hunt Hwy (the County Line).

* The upper bound of the confidence interval at 90% confidence level is the value which 5% of the simulated quantile values for a given frequency are greater than.
** These precipitation frequency estimates are based on a partial duration series. ARI is the Average Recurrence Interval.
Please refer to the documentation for more information. NOTE: Formatting prevents estimates near zero to appear as zero.

*** Lower bound of the 90% confidence interval**

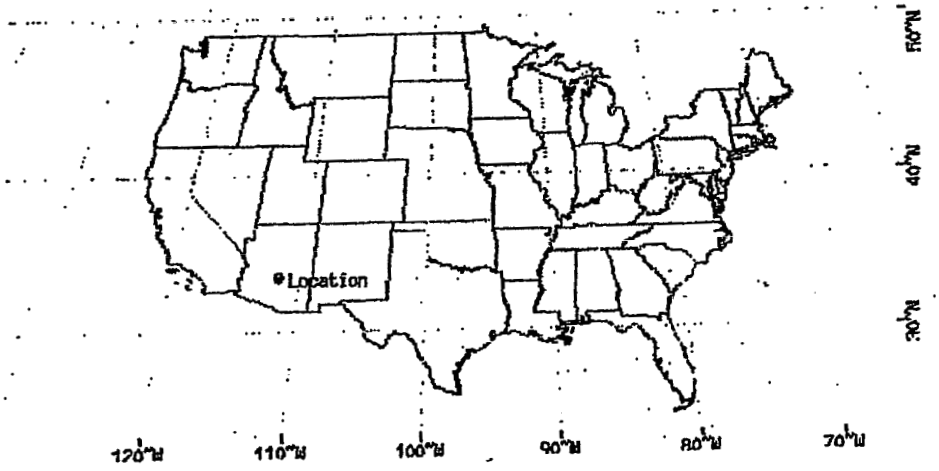
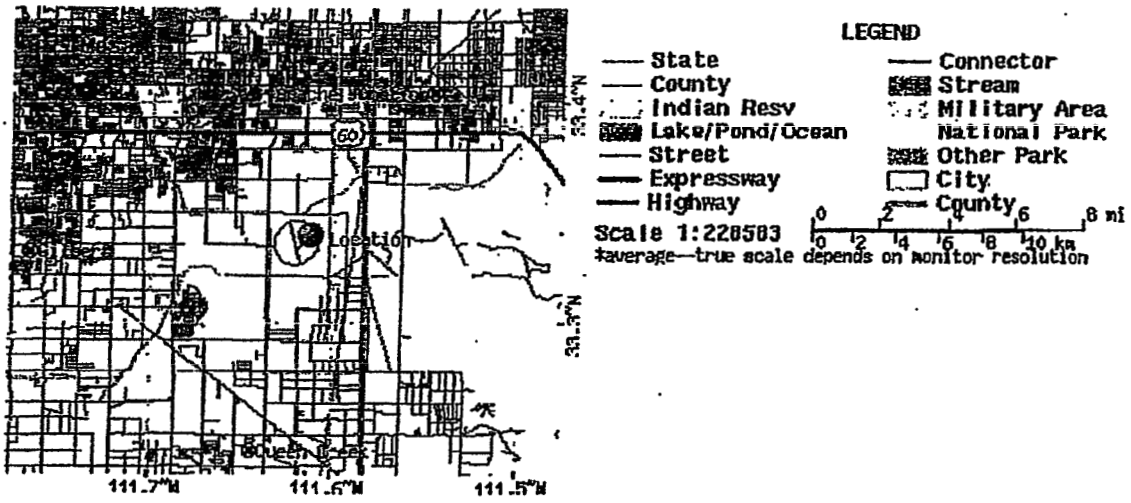
Maps -



These maps were produced using a direct map request from the U.S. Census Bureau Mapping and Cartographic Resources Tiger Map Server.

Please read disclaimer for more information.



Other Maps/Photographs -

View USGS digital orthophoto quadrangle (DOQ) covering this location from TerraServer; USGS Aerial Photograph may also be available
from this site. A DOQ is a computer-generated image of an aerial photograph in which image displacement caused by terrain relief and camera tilts has been removed. It combines the image characteristics of a photograph with the geometric qualities of a map. Visit the USGS for more information.

Watershed/Stream Flow Information -

Find the Watershed for this location using the U.S. Environmental Protection Agency's site.

Climate Data Sources -

Precipitation frequency results are based on data from a variety of sources, but largely NCDC. The following links provide general information
about observing sites in the area, regardless of if their data was used in this study. For detailed information about the stations used in this study,
please refer to our documentation.

Using the National Climatic Data Center's (NCDC) station search engine, locate other climate stations within:

+/-30 minutes ...OR... +/-1 degree of this location (33.3325/-111.62). Digital ASCII data can be obtained directly from NCDC.

Find Natural Resources Conservation Service (NRCS) SNOTEL (SNOwpack TELemetry) stations by visiting the Western Regional Climate Center's state-specific SNOTEL station maps.

 407          ID
 408          ID    ID  Kirkham Michael:
 409          ID    Last Revised Date:  1/22/03
 410          ID    Filename:  WS4-SEM.DAT
 411          ID
 412          ID    Comments Dated 1/22/03 (CJ)
 413          ID
 414          ID    This model should be used ONLY for the Rittenhouse and Chandler Heights
 415          ID    Basin Design Project - Final Design Analyses.
 416          ID
 417          ID    This model is one of several models that represent the EMF watershed.
 418          ID    This model covers the Southeast Mesa Area and should reference as a DSS
 419          ID    the watershed model for the Northeast Mesa Area (Filename WS2-NEM.DAT).
 420          ID
 421          ID    This model is necessary to determine the input hydrographs for the
 422          ID    Rittenhouse Basin Design HEC-RAS Unsteady State analysis.  To develop
 423          ID    the necessary input hydrographs the following models should be run in order.
 424          ID    Because the files utilize a TAPE21 file to export import hydrographs
 425          ID    between models, prior to running the FIRST model (WS1-NWM.DAT) any existing
 426          ID    TAPE21 file in the directory should be deleted.  The run procedure order is:
 427          ID
 428          ID         1)  WS1-NWM.DAT
 429          ID         2)  WS2-NEM.DAT
 430          ID         3)  WS3-QCSW.DAT
 431          ID         4)  WS4-SEM.DAT (referencing WS2-NEM.DSS for the DSS file)
 432          ID         5)  RT1-BASE.DAT
 433          ID
 434          ID    The necessary input hydrographs for the Rittenhouse Basin analysis
 435          ID    are determined in RT1-BASE.  In that output file, the hydrograph at
 436          ID    RWFLD1 should be exported and used as the input hydrograph at the
 437          ID    EMF Reach 4 Cross Section 17.082.  And the hydrograph at RITTEN should
 438          ID    be exported and used as the input hydrograph for the Rittenhouse Main
 439          ID    Channel at Cross Section 820.00
 440          ID

3575          KM
3576          KM  On 12.16.97 - made changes to sub-basins 62C & 62D per County
3577          KM  On 12.17.97 - revised detention Basin DB82A1
3578          KM  On 12.18.97 - Siphon Draw basin to be on-line facility, rearranged sequence
3579          KM  On 12.19.97 - Basin MN4B near Powerline Floodway, data based on grading plan
3580          KM  - Revised Channel Routing parameters for Area 1
3581          KM  On 01.05.98 - Revised Detention Basin DB82A1 & DB82B.
3582          KM  - Coordinated file with FB.
3583          KM  On 01.12.98 - Revised Hydrology per County '97 Land Use Parameters
3584          KM  - File Updated by DDMS
3585          KM  - Retention revised per County '97 Land Use Parameters
3586          KM  On 01.14.98 - Revised routing along the Santan Alignment
3587          KM  On 01.19.98 - Revised channel routing parameters, Area 2 for channel design.
3588          KM  On 01.26.98 - Revised channel routing slopes in non-ADMP design areas to
3589          KM  match the MAG97 values found in file FUTSOUTH.DAT from FCDMC
3590          KM  On 01.26.98 - Revised wording at CAP1A and CAP1B to reflect 217 cfs per
3591          KM  overchute location, not per pipe.  This per Valerie Swick.
3592          KM  On 01.27.98 - Copied the KK 91 to KK EMFRIT sequence from FUTSOUTH.DAT
3593          KM  and revised diagram sequence to add in Santan Fwy channel.
3594          KM  On 01.27.98 - Slope and NSTEPS values for some natural channels input from
3595          KM  the District-supplied file "FUTSOUTH.DAT".
3596          KM  On 01.28.98 - Revised hydrograph names near EMF at Rittenhouse area.
3597          KM  On 02.12.98 - Revised minor station error in channel route 65AT66, RX record
3598          KM  On 02.23.98 - Revised per
3599          KM  FCDMC comments:  Reworded KM record for route 65AT66.
3600          KM  Length for route 65T66 revised to 2400 feet.
3601          KM  KM added to 78B to explain why no retention.
3602          KM  Added channel route for CP82A4 to CP82A5.
1                                        HEC-1 INPUT                                                    PAGE 97

LINE          ID.......1.......2.......3.......4.......5.......6.......7.......8.......9......10

3603          KM  Added 0.25 ratio @ Basin 75, removed retention
3604          KM  On 02.24.98 - Revised Rittenhouse Channel routing to reflect plans
3605          KM  per FCD Contract No. 97-34 (Phase 2)
3606          KM
3607          KM  On 03.03.98 - Received This File as FINAL HYDROLOGY from the FCDMC
3608          KM  On 03.04.98 - Revised flow routing to show the PLF connecting to
3609          KM  the Santan Channel.  Also re-ordered subbasin 80a
3610          KM  to enter the system at the proper location.
3611          KM  On 03.06.98 - Revised KM record for EMFKNX to delete reference to C76A.
3612          KM  On 03.10.98 - Revised preliminary channel sizes from design data.
3613          KM  Added routing reaches represented in design. (Area 1).
3614          KM  On 03.12.98 - Regraded Crismon Basin to avoid ADWR jurisdictional dam.
3615          KM  On 03.13.98 - Revised Siphon Draw Basin to avoid ADWR jurisdictional dam.
3616          KM  On 03.24.98 - Revised normal depth channel routing per Area 2 channel design.
3617          KM  On 04.22.98 - Submitted Hydrology to County.
3618          KM  On 05.20.98 - Revised Hydrology per County Comments
3619          KM  On 06.11.98 - Revised channel properties to reflect earth channels
3620          KM  On 06.12.98 - Submitted file to County (This is a pre-final submittal)
3621          KM
3622          KM  On 06.18.98 - Added combine at Knox Road for better flowrate resolution.
3623          KM
3624          KM  On 07.17.98 - Revised per FCD review comments.  Channel routings revised to
3625          KM  follow the ADMP Preliminary Design Plans.  More verbal
3626          KM  descriptions for channel routings added.
3627          KM
3628          KM  On 07.24.98 - This is the final submittal HEC-1 input file.
3629          KM
3630          KM  On 08.06.98 -Back checked entire file against FCDMC review comments printout.
3631          KM
3632          KM  On 10.21.98 -Revised routing at Elliot basin for prelim. 30% design.
3633          KM
3634          KM  On 10.27.98 -Revised divert for retention at Elliot Basin.
3635          KM
3636          KM  On 01.15.99 -File submitted as part of Elliot Basin Addendum to the ADMP.

FILE: EM125W.DAT

MODEL REVISED: 2-16-2021

PROJECT: EASTMARK MASTER DRAINAGE UPDATE (FOR DU 1,2, AND 5W)

THIS IS A POST DEVELOPED MODEL REVISION TO REFLECT PLANNED LAND USES
FOR THE UNDEVELOPED UNITS, SPECIFICALLY DU 1, DU 2, DU 5E, DU 5W,
DU 6S, AND DU 6N.

MODEL REVISION DESCRIPTION:

THIS MODEL IS AN EXERPT OF THE MODEL PROVIDED BY THE FLOOD CONTROL
DISTRICT OF MARICOPA COUNTY (WS4-SEM.DAT).COMBINED DU 1, DU 2, AND
DU 5W, WHICH IS CALLED DU 1-2-5W. REVISED BOUNDARY AND LAND USES
WITHIN DU 6N AND DU 6S.REVISED SUBBASINS 8 AND 10 BOUNDARIES TO
REFLECT AS-BUILTS. REVISED LAND USES WITHIN UNDEVLEOPED PARCELS
WITHIN DU 3/4 TO REFLECT MORE DETAILED PLANNING.
THE 100-YEAR, 24-HOUR RETENTION REQUIREMENTS HAVE BEEN
DISTRIBUTED TO PORTIONS OF DU 2, DU 3/4, DU 5, DU 5N, DU 6N
AND DU 7S.

MODEL REVISED BY:
WOOD, PATEL & ASSOCIATES, INC.
STEVEN MCKEE, P.E.

FILE: EMDU34.DAT

MODEL REVISED: 12-02-2019

PROJECT: EASTMARK MASTER DRAINAGE UPDATE (FOR DU 2 AND 3/4)

THIS IS A POST DEVELOPED MODEL REVISION TO REFLECT PLANNED LAND USES
FOR DEVELOPMENT UNITS 2 AND 3/4.

MODEL REVISION DESCRIPTION:

THIS MODEL IS AN EXERPT OF THE MODEL PROVIDED BY THE FLOOD CONTROL
DISTRICT OF MARICOPA COUNTY (WS4-SEM.DAT). REVISED DU 1, DU 2, DU 3/4,
DU 5 NORTH,DU 6 NORTH, DU 6 SOUTH, AND DU 7 NAMING,BOUNDARIES, AND LAND
USES. RESIDENTIAL LOT COUNTS WITHIN DU 3/4 TO REFLECT APPROVED PLANS.
REVISED LAND USES WITHIN DU 1 AND 2.
THE 100-YEAR, 24-HOUR RETENTION REQUIREMENTS HAVE BEEN
REDISTRIBUTED TO PORTIONS OF DU 2, DU 3/4, DU 5, DU 5N, DU 6N
AND DU 7S.

MODEL REVISED: 09-18-2017

PROJECT: EASTMARK MASTER DRAINAGE UPDATE (FOR DU 3/4)

THIS IS A POST DEVELOPED MODEL REVISION TO REFLECT PLANNED LAND USES
FOR DEVELOPMENT UNIT 3/4.

MODEL REVISION DESCRIPTION:

THIS MODEL IS AN EXERPT OF THE MODEL PROVIDED BY THE FLOOD CONTROL
DISTRICT OF MARICOPA COUNTY (WS4-SEM.DAT). REVISED DU 3/4, DU 5 NORTH,
DU 6 NORTH, AND DU 6 SOUTH NAMING, BOUNDARIES, AND LAND USES.
RESIDENTIAL LOT COUNTS WITHIN DU 6S TO REFLECT APPROVED PLANS.
REVISED LAND USES WITHIN DU 1 AND 2.
THE 100-YEAR, 24-HOUR RETENTION REQUIREMENTS HAVE BEEN
REDISTRIBUTED TO PORTIONS OF DU 2, DU 3/4, DU 5, DU 5N, AND
DU 7S.

FILE: EMDU56.DAT

MODEL REVISED: 04-04-2017

PROJECT: EASTMARK MASTER DRAINAGE UPDATE (FOR DU 5,DU 5N, AND DU 6S)

THIS IS A POST DEVELOPED MODEL REVISION TO REFLECT PLANNED LAND USES
FOR DEVELOPMENT UNITS 5, 5N, AND 6S (DU 5, DU 5N, AND DU 6S).

MODEL REVISION DESCRIPTION:

THIS MODEL IS AN EXERPT OF THE MODEL PROVIDED BY THE FLOOD CONTROL
DISTRICT OF MARICOPA COUNTY (WS4-SEM.DAT). REVISED DU 5 NORTH, DU 5,
AND DU 6 SOUTH NAMING, BOUNDARIES, AND LAND USES. REPLACED THE
UNIVERSITY LAND USE FROM DU 3/4 WITH OFFICE AND RESIDENTIAL UNITS.
REVISED LAND USE IN PARCEL 7-24 FROM CHURCH TO EDUCATION. REVISED
RESIDENTIAL LOT COUNTS WITHIN DU 3 SOUTH,DU 6S, AND DU 8 TO REFLECT
APPROVED PLANS. REVISED LAND USES FOR OFFSITE SUBBASIN 77C TO REFLECT
MOUNTAIN HORIZONS SOUTH CONSTRUCTION. REVISED SUBBASIN BOUNDARIES
BASED ON A REVISED MASS GRADING PLAN AND ADDITIONAL DIRECTION PROVIDED
BY DMB. THE 100-YEAR, 24-HOUR RETENTION REQUIREMENTS HAVE BEEN
REDISTRIBUTED TO PORTIONS OF DU 2, DU 3/4, DU 5, DU 5N, DU 6N, AND
DU 7S. SUBBASIN 11 HAS BEEN DIVIDED INTO WATERSHEDS 11A AND 11B.
OUTFALLS FOR SUBBASINS 5A, 5B, 6A, 6B WERE DETERMINED BASED ON DIRECTION
FROM DMB AND DESIGN CONSULTANTS OF DU 5 AND DU 6S. THE OFFSITE RETENTION
FOR SUBBASINS 73B, 73C, 74B, 74C, 77B, 77C, AND 78C WERE UPDATED TO MORE
CLOSELY REFLECT DEVELOPMENT WITHIN THESE WATERSHEDS.

MODEL REVISED BY:

MODEL REVISED: 04-18-2014

PROJECT: EASTMARK MASTER DRAINAGE UPDATE (FOR DEVELOPMENT UNIT 5 EAST)

THIS IS A POST DEVELOPED MODEL REVISION TO REFLECT PLANNED LAND USES
FOR DEVELOPMENT UNIT 5 EAST (DU 5E).

MODEL REVISION DESCRIPTION:

THIS MODEL IS AN EXERPT OF THE MODEL PROVIDED BY THE FLOOD CONTROL
DISTRICT OF MARICOPA COUNTY (WS4-SEM.DAT). LAND USE FOR DU 5E HAS
CHANGED FROM GOLF TO INDUSTRIAL. AREAS THAT PREVIOUSLY DRAINED TO GOLF
WHERE 100-YEAR, 24-HOUR RETENTION WAS PROVIDED WILL NOW BE REQUIRED TO
SELF RETAIN RETENTION VOLUME FROM THEIR SITE FOR THE 100-YEAR, 24-HOUR
STORM PEAK FLOWS HAVE REMAINED THE SAME. THE REMAINING PORTION OF LAND
THAT WAS ASSOCIATED WITH GOLF HAS BEEN REVISED TO RESIDENTIAL USE.

MODEL REVISED BY:
WOOD, PATEL & ASSOCIATES, INC.
DANIEL MATTHEWS, P.E.

MODEL REVISED: 04-14-2014

PROJECT: EASTMARK MASTER DRAINAGE UPDATE FOR DEVELOPMENT UNIT 3/4

THIS IS A POST DEVELOPED MODEL REVISION TO REFLECT PLANNED LAND USES
FOR DEVELOPMENT UNIT 3/4 (DU 3/4).

MODEL REVISION DESCRIPTION:

THIS MODEL IS AN EXERPT OF THE MODEL PROVIDED BY THE FLOOD CONTROL
DISTRICT OF MARICOPA COUNTY (WS4-SEM.DAT). LAND USE FOR DU 3/4 HAS BEEN
REVISED TO REFLECT MORE DETAILED PLANNING. MINOR ADJUSTMENTS TO LAND
USES OUTSIDE OF DU 3/4 HAVE BEEN MADE. ADDITIONALLY WATERSHED
BOUNDARIES HAVE BEEN REVISED TO REFLECT A CONCEPTUAL MASS GRADE PLAN
PROVIDED TO WOOD/PATEL BY A CONSULTANT OF THE DEVELOPER DMB MESA
PROVING GROUNDS LLC.

MODEL REVISED BY:
WOOD, PATEL & ASSOCIATES, INC.

FILE: MPGDU7.DAT

MODEL REVISED: 09-07-2011

PROJECT: MESA PROVING GROUNDS

THIS MODEL SHOULD REPLACE WS4-SEM.DAT IN THE HEC-1 RUN SEQUENCE SPECIFIE
BELOW. REFERENCING WS2-NEM.DSS IS STILL REQUIRED.

THIS IS A POST DEVELOPED MODEL REVISION TO REFLECT UPDATED PLANNING
FOR DEVELOPMENT UNIT 7 (DU7)PROVIDED BY ARIZONA LAND DESIGN ON 09/02/201
09/02/2011.

MODEL REVISION DESCRIPTION:

THIS MODEL IS AN EXERPT OF THE MODEL PR0VIDED BY THE FLOOD CONTROL
DISTRICT OF MARICOPA COUNTY (WS4-SEM.DAT). ONSITE WATERSHEDS WERE
UPDATED TO REFLECT A GRADING PLAN PROVIDED BY LD TEAM ON 8/30/2011.
MODELING OF THE POWERLINE FLOODWAY HAS BEEN UPDATED TO REFLECT THE
EXISTING SECTIONS AND SLOPE PER AS-BUILT DRAWINGS ACROSS THE MPG
SITE.

MODEL REVISED BY:
WOOD, PATEL & ASSOCIATES, INC.

****

FILE: MPG20RT2.DAT

MODEL REVISED: 04-25-2011

PROJECT: MESA PROVING GROUNDS

THIS MODEL SHOULD REPLACE WS4-SEM.DAT IN THE HEC-1 RUN SEQUENCE SPECIFIE
BELOW. REFERENCING WS2-NEM.DSS IS STILL REQUIRED.

THIS IS A 100-YEAR, 2-HOUR RETENTION SCENARIO MODEL USING
THE 20MSF COMMERCIAL SPACE AND 15K DU LAND PLAN PROVIDED
BY SWABACK PARTNERS ON 12/12/07.

MODEL REVISION DESCRIPTION:

THIS MODEL IS AN EXERPT OF THE MODEL PR0VIDED BY THE FLOOD CONTROL
DISTRICT OF MARICOPA COUNTY (WS4-SEM.DAT). ONSITE WATERSHEDS 01 AND
20 WERE UPDATED TO REFLECT THE INCORPORATION OF THE FIRST SOLAR SITE
IN THE NORTHEAST CORNER OF DU-6. WATERSHED 02 WAS SPLIT INTO 02A AND
02B. LAND USE WAS CHANGED TO INDUSTRIAL FOR 02B AND ENTIRELEY
RESIDENTIAL FOR 02A.
THE FIRST SOLAR SITE RUNOFF WILL NOW BE RETAINED ENTIRELY ONSITE.

MODEL REVISED BY:
WOOD, PATEL & ASSOCIATES, INC.
STEPHEN M. SCINTO, P.E.

 ID  Kirkham Michael:
 Last Revised Date:  1/22/03
 Filename:  WS4-SEM.DAT

 Comments Dated 1/22/03 (CJ)
```

```
  This model should be used ONLY for the Rittenhouse and Chandler Heights
  Basin Design Project - Final Design Analyses.

  This model is one of several models that represent the EMF watershed.
  This model covers the Southeast Mesa Area and should reference as a DSS
  the watershed model for the Northeast Mesa Area (Filename WS2-NEM.DAT).

  This model is necessary to determine the input hydrographs for the
  Rittenhouse Basin Design HEC-RAS Unsteady State analysis.  To develop
  the necessary input hydrographs the following models should be run in order.
  Because the files utilize a TAPE21 file to export import hydrographs
  between models, prior to running the FIRST model (WS1-NWM.DAT) any existing
  TAPE21 file in the directory should be deleted.  The run procedure order is:

       1)  WS1-NWM.DAT
       2)  WS2-NEM.DAT
       3)  WS3-QCSW.DAT
       4)  WS4-SEM.DAT (referencing WS2-NEM.DSS for the DSS file)
       5)  RT1-BASE.DAT

  The necessary input hydrographs for the Rittenhouse Basin analysis
  are determined in RT1-BASE.  In that output file, the hydrograph at
  RWFLD1 should be exported and used as the input hydrograph at the
  EMF Reach 4 Cross Section 17.082.  And the hydrograph at RITTEN should
  be exported and used as the input hydrograph for the Rittenhouse Main
  Channel at Cross Section 820.00

           REVISIONS TO THE REGIONAL DETENTION BASIN STORAGE
 REVISED - FEB, 1999 BY VALERIE SWICK, FCD OF MARICOPA COUNTY
 REVISED - MAY, 1998 BY D&A

 REVISED BY VALERIE SWICK, FEB. 26, 1998

 FLOWS FROM DETENTION BASIN LOCATED AT NE CORNER OF ELLIOT AND ELLSWORTH ROADS
 IS ROUTED TO THE SOUTHWEST BY SIPHON DRAW TO SUBBASIN 70A. FROM THERE THEY
 WILL BE ROUTED BY A CHANNEL TO THE EMF. FLOWS FROM SUBBASINS ADJACENT TO
 SANTAN FREEWAY ALIGNMENT WILL BE ROUTED SOUTH TO SUBBASIN 70A WHERE THEY WILL
 BE COMBINED WITH FLOW IN SIPHON DRAW.

 EAST MESA AREA DRAINAGE MASTER PLAN
 AREA SOUTH OF SUPERSTITION (U.S. HWY 60)
 AUGUST 1997
 SOUTHEAST MESA HIGH RESOLUTION MODEL

 **********FUTURE CONDITION MODEL OF THE WATERSHED************************

************ATTENTION*************************************************
  SUBBASINS 75, 79A, 79B, 78E,  LANDUSES WERE NOT
  CHANGED BECAUSE IT WAS FELT THAT THEIR FUTURE CONDITIONS LANDUSES WOULD BE
  SIMILAR TO THE EXISTING CONDITIONS LANDUSES.
  RETENTION VOLUMES WILL ALSO NOT BE UTILIZED FOR SUBBASINS 75, 79A, 79B, 78E
  SOME QUEEN CREEK SUBBASINS WILL ALSO NOT HAVE RETENTION VOLUMES, EITHER
  BECAUSE THEY LIE IN PINAL COUNTY AND WE DONT KNOW PINAL COUNTIES PLANS OR
  THEY LIE IN THE SANTAN MOUNTAINS AND WON'T GET DEVELOPED
  WILLIAMS GATEWAY AIRPORT (SUBBASINS 80A, 80B, 81A, AND 81B) ARE MODELED AS
  FUTURE CONDITIONS AND HAVE RETENTION VOLUMES FOR THE 100YR 2HR STORM

Onsite Retention Volume Summary

Table 10 - Onsite Retention Volume Summary

Description: Calculation of Required Retention Volume Using the Rational Method

Location Eastmark

Reference: Drainage Design Manual for Maricopa County, Vol. I, Hydrology

Known Values: Design storm: 100-yr, 2-hr 100-yr, 24-hr
Rainfall, D: 2.19 inches 3.51 inches

Calc. Values: V = DAC
Where: V = Retention Volume Required
D = Depth of Rainfall (ft)
A = Area of Watershed Contributing
C = Runoff Coefficient

Retention Basin	Retention Location	Sub-basin		Development Unit		Weighted "C_{100}"	Required Storm Event Retention	Volume Required (acre-feet)	Total Volume Required (acre-feet)	Volume Provided (acre-feet)	Total Volume Provided (acre-feet)	Modeled HEC-1 Retention Volume (acre-feet)

Table 10 - Onsite Retention Volume Summary

Description: Calculation of Required Retention Volume Using the Rational Method

Location Eastmark

Reference: Drainage Design Manual for Maricopa County, Vol. I, Hydrology

Known Values: Design storm: 100-yr, 2-hr 100-yr, 24-hr
Rainfall, D: 2.19 inches 3.51 inches

Calc. Values: V = DAC
Where: V = Retention Volume Required
D = Depth of Rainfall (ft)
A = Area of Watershed Contributing
C = Runoff Coefficient

							Total	**430.65**	**430.65**	**215.84**	**215.84**	**426.03** **ac-ft**

1. Retention provided volume for RET02B was taken from the First Solar Final Drainage Report, where only approximately half of 2B is developed.
2. Retention provided volumes for RET08 and RET10 were taken from DU7 and Ray Road Final Drainage Reports and improvement plans.
3. Retention provided volumes for RET06A was taken from DU6 South Final Drainage Reports and improvement plans.
4. Required Retention for RET09 was determined to be the 100-year, 24 hour volume except for the existing Basis and Sequoia Pathfinder Acadamy schools and the existing daycare. The total acreage for these three existing developments within Subbasin 9 is approximately 11 Acres. Thus, the required retention for RET09 includes 100-year, 24 hour volume for the Great Park and the New Home Company Site located at the southwest corner of Eastmark Parkway and Point Twenty-Two Boulevard.
5. Within the approved *Final Drainage Report for Eastmark DU 3/4 North-Phases 2 & 3* , a portion of the retention required within Sub-basins 7B and 7C was determined from the 100-year, 24-hour storm event and the 100-year, 2-hour storm event based upon previous approved master plan reports. Because of the freeboard provided in the retention basins, the actual retention provided is nearly the 100-year, 24-hour storm event volume. Thus, for this table, the required retention is shown as the volume from the 100-year, 24-hour storm event.

Retention Basin	Retention Location	Sub-basin		Development Unit		Weighted "C_{100}"	Required Storm Event Retention	Volume Required (acre-feet)	Total Volume Required (acre-feet)	Volume Provided (acre-feet)	Total Volume Provided (acre-feet)	Modeled HEC-1 Retention Volume (acre-feet)

Notes:

1) Within Subbasin 79A is the "Cadence" master planned community. Portions of this community are constructed and portions are currently under construction. The estimated retention provided for Cadence was assumed to be the 100-year, 2-hour retention volume. With a precipitaion depth of 2.2 inches and a runoff coefficient of 0.65; 80% of the total provided retention is approimated at 54 acre-feet.

2) The existing retention basins along Ray and Signal Butte Road collect a portion of runoff from Ray Road and Signal Butte Road. The total volume provided is 5.55 acre-feet taken from *Eastmark E. Ray Road Improvement Plans* dated 6-20-2013 by Hoskin Ryan Consultants.

NOTES:

1) THE CUMULATIVE REQUIRED RETENTION VOLUME FOR EACH RETENTION BASIN HAS BEEN PROVIDED. PROPOSED RETENTION BASIN SIZES AND LOCATIONS ARE SHOWN SCHEMATICALLY AND ARE SUBJECT TO CHANGE.

2) PORTIONS OF SUBBASINS 7B, 7C, AND 9 WERE DESIGNED TO RETAIN THE 100-YEAR, 24-HOUR VOLUME BASED ON PREVIOUS MASTER PLAN UPDATES. THE ACTUAL RETENTION PROVIDED FOR THESE SUBBASINS HAS BEEN MODELED FOR THIS MASTER PLAN UPDATE. THE ACTUAL VOLUME PROVIDED IS BETWEEN THE 100-YEAR, 2-HOUR AND 100-YEAR, 24-HOUR VOLUME.
